MERN STACK
TRAINING TR-103 REPORT DAY 2 23 JUNE 2026

Overview:

The second day of training focused on creating HTML forms and understanding different form controls used to collect information from users. The session covered radio buttons, checkboxes and dropdown lists. I was also introduced to Cascading Style Sheets (CSS), which is used to style and improve the presentation of HTML webpages. The session introduced the inline and internal methods of applying CSS.

Learning Objectives:

- Learn how to create a basic HTML form.
- Understand the use of radio buttons in HTML forms.
- Understand the use of checkboxes in HTML forms.
- Learn how to create dropdown lists for selecting options.
- Understand the basic purpose of Cascading Style Sheets (CSS).
- Learn the inline and internal methods of applying CSS.

HTML Forms

An HTML form is used to collect information from users. During the practical session, I learned how form elements can be placed together to create an interactive form. Different controls can be used depending on the type of information that needs to be collected.

Form Controls

I learned about different form controls and practiced using them while creating an HTML form.

Radio Button

A radio button is used when the user needs to select one option from a group of available options. I learned how radio buttons can be included in an HTML form to allow a user to choose a single option.

Checkbox

A checkbox is used when users can select one or more options. I learned how checkboxes can be added to an HTML form and used for selecting multiple choices.

Dropdown List

A dropdown list provides a list of options from which the user can select an option. I learned how dropdown lists are created in HTML forms and how they can make forms more organized when several choices are available.

Cascading Style Sheets (CSS)

I was introduced to Cascading Style Sheets (CSS), which is used to control the styling and presentation of HTML content. CSS can be used to improve the appearance of webpages by applying styles to HTML elements.

Methods of Applying CSS

During the training session, I learned two methods of applying CSS:

1. Inline CSS

Inline CSS is applied directly to an HTML element using the style attribute. It is useful when a style needs to be applied directly to a particular element.

2. Internal CSS

Internal CSS is written inside a style section within the HTML document. It can be used to define styles for elements on the same webpage.

Practical Work

During the practical session, I created an HTML form and practiced using different form controls such as radio buttons, checkboxes and dropdown lists. I also practiced applying CSS to HTML elements using the inline and internal methods. This helped me understand how HTML is used for webpage structure while CSS is used for webpage styling.

Key Learning

- HTML forms are used to collect information from users.
- Radio buttons are useful for selecting one option from a group.
- Checkboxes can be used to select multiple options.
- Dropdown lists provide a structured way to select an option.
- CSS is used to style and improve the presentation of HTML content.
- Inline CSS can be applied directly to an HTML element.
- Internal CSS can be written within the HTML document to style its elements.

Conclusion:

The second day of training helped me understand how HTML forms are created and how different form controls are used to collect user input. I also learned the basic concept of CSS and practiced applying styles using inline and internal CSS. The session strengthened my understanding of the relationship between HTML structure and webpage styling.
