MERN STACK

TRAINING TR-103 REPORT DAY 6 29 JUNE 2026

Overview:

The sixth day of training focused on functions in JavaScript. I learned how to define and use functions, including functions with parameters and functions without parameters. The session also introduced arrow functions and their basic syntax.

Learning Objectives:

• Understand the purpose of functions in JavaScript.

• Learn how to define and call a function.

• Understand functions with parameters and without parameters.

• Learn the basic syntax and use of arrow functions.

JavaScript Functions

A function is a reusable block of code designed to perform a particular task. A function can be defined once and called whenever it is needed, which helps organize code and avoid repetition.

Function Definition

A function definition specifies the function's name and the code that will run when the function is called. After defining a function, it can be invoked by using its name followed by parentheses.

Functions Without Parameters

A function without parameters does not receive any input values through its parameter list. It performs its task using the statements written inside the function body.

Functions With Parameters

Parameters are names listed in a function definition to receive values when the function is called. They allow the same function to work with different input values.

Arrow Functions

Arrow functions provide a shorter way to write function expressions in JavaScript. They use the arrow symbol (=>) between the parameter list and the function body. Arrow functions can make function code more concise.

Key Learning:

• Learned the purpose and definition of JavaScript functions.

• Understood how to call a function to execute its code.

• Learned the difference between functions with parameters and without parameters.

• Learned the basic syntax of arrow functions.

Conclusion:

The sixth day of training helped me understand how functions make JavaScript code reusable and organized. I learned function definitions, functions with and without parameters, and arrow functions, which are useful for writing concise and structured programs.
