MERN STACK
TRAINING TR-103 REPORT DAY 1 22 JUNE 2026

Overview:

The first day of training introduced us to the fundamental concepts of **HTML (HyperText Markup Language)**, which is used to create and structure content on webpages. The session focused on understanding the basic structure of an HTML document, commonly used HTML tags, and formatting tags used to present text in a clear and organized manner. It provided a foundation for understanding how webpages are structured before moving towards other areas of web development.

Learning Objectives:

- Understand the basic concept and purpose of HTML.
- Learn the basic structure of an HTML document.
- Understand the use of commonly used HTML tags.
- Learn HTML formatting tags and their purpose in presenting text.

Introduction to HTML

HTML (HyperText Markup Language)

HTML is the standard markup language used to structure content on webpages. It tells the web browser how different pieces of content should be organized, such as headings, paragraphs, links and other elements. HTML uses tags to define and organize these elements.

Basic Structure of an HTML Document

I learned that an HTML document generally contains a document declaration, an **<html>** element, a **<head>** section and a **<body>** section. The head contains information about the document, while the body contains the visible webpage content.

HTML Tags

HTML tags are used to define different elements of a webpage. Tags are written inside angle brackets and are generally used in pairs consisting of an opening tag and a closing tag. Some tags are used without a separate closing tag.

Common HTML Tags Learned

- **<html>** – defines the main HTML document.
- **<head>** – contains information about the webpage.
- **<title>** – defines the title displayed in the browser tab.
- **<body>** – contains the visible content of the webpage.
- **<h1> to <h6>** – used for headings of different levels.
- ** ** – used to create paragraphs.
- **<a>** – used to create hyperlinks.
- **<img>** – used to display images.
- **
** – used to insert a line break.
- **<ul>, <ol> and ** – used to create unordered lists, ordered lists and list items.

Understanding HTML Elements

During the practical session, I learned that an HTML element can consist of an opening tag, content and a closing tag. For example, a paragraph can be created using ** Text **. Different elements can be combined to form the complete structure of a webpage.

HTML Formatting Tags

Formatting tags are used to change or emphasize the presentation of text in an HTML document. I learned how formatting tags can be used to make important content visually distinct and easier to understand.

Formatting Tags Learned

- **<b>** – makes text bold.
- **** – indicates strong importance and normally displays text in bold.
- **<i>** – displays text in italic style.
- **** – emphasizes text and normally displays it in italic style.
- **<u>** – underlines text.
- **<mark>** – highlights text.
- **<small>** – displays text in a smaller size.
- **<del>** – represents deleted text.
- **<ins>** – represents inserted text.
- **<sub>** – displays subscript text.
- **<sup>** – displays superscript text.

Practical Work

I practiced creating basic HTML content using different tags and learned how the tags affect the structure and appearance of text on a webpage. I also practiced using formatting tags to make selected text bold, italic, underlined, highlighted, deleted, inserted, subscript and superscript.

Key Learning

- HTML provides the basic structure of a webpage.
- HTML tags define different types of webpage content.
- Different heading and paragraph tags help organize information.
- Formatting tags can be used to emphasize and present text appropriately.
- Understanding HTML tags is an important foundation for further frontend development.

Conclusion:

The first day of training provided a basic understanding of HTML and its role in web development. I learned the basic structure of an HTML document, commonly used HTML tags and different formatting tags. The practical work helped me understand how webpage content is organized and displayed by a browser. This session established the foundation for learning further frontend development concepts during the training.
