MERN STACK

TRAINING TR-103 REPORT DAY 5 26 JUNE 2026

Overview:

The fifth day of training focused on JavaScript conditional statements and loops. The session covered the if-else, nested if-else, else-if and switch statements. I also learned different types of loops, including while, do-while and for loops.

Learning Objectives:

• Understand the concept of conditional statements in JavaScript.

• Learn how to use if-else statements.

• Understand nested if-else and else-if statements.

• Learn how to use the switch statement.

• Understand the purpose of loops in JavaScript.

• Learn while, do-while and for loops.

Conditional Statements

Conditional statements allow a program to make decisions based on whether a condition is true or false. They control which block of code is executed.

1. If-Else

The if-else statement executes one block when a condition is true and another block when the condition is false.

2. Nested If-Else

A nested if-else statement places one if-else statement inside another. It is useful when more than one condition needs to be checked.

3. Else-If

The else-if statement checks multiple conditions in sequence and executes the block for the first condition that evaluates to true.

4. Switch Statement

The switch statement selects a block of code based on the value of an expression and its matching case.

Loops

Loops are used to execute a block of code repeatedly while a specified condition allows the repetition to continue.

While Loop

The while loop checks its condition before each iteration and repeats the code while the condition remains true.

Do-While Loop

The do-while loop executes the code block before checking its condition, so the block runs at least once.

For Loop

The for loop repeats a block of code using initialization, a condition and an update expression to control the iterations.

Key Learning:

• Learned how conditional statements are used for decision-making in JavaScript.

• Learned the use of if-else, nested if-else, else-if and switch statements.

• Understood the purpose and working of while, do-while and for loops.

• Learned how loops reduce repeated code and control program execution.

Conclusion:

The fifth day of training helped me understand how JavaScript uses conditional statements to make decisions and loops to repeat tasks. These concepts form an important foundation for writing logical JavaScript programs.
