MERN STACK
TRAINING TR-103 REPORT DAY 3 24 JUNE 2026

Overview:

The third day of training focused on webpage layout using HTML and CSS, followed by an introduction to JavaScript. I learned how the div tag can be used to organize webpage content and practiced CSS Flexbox properties such as display flex, justify-content and align-items. I also learned how CSS Grid can be used to arrange elements in rows and columns. The session then introduced JavaScript, including different methods of adding JavaScript to an HTML page, console.log() for displaying output and variables.

Learning Objectives:

- Understand the purpose of the div tag in HTML.
- Learn how to use CSS Flexbox for webpage layouts.
- Understand justify-content and align-items.
- Learn how CSS Grid arranges elements into rows and columns.
- Understand the basic purpose of JavaScript.
- Learn the inline, internal and external methods of using JavaScript.
- Use console.log() to display output in the browser console.
- Understand variables in JavaScript.

Div Tag

The div tag is a container element in HTML that is used to group and organize content. I learned how div elements can be combined with CSS properties to create structured webpage layouts.

CSS Flexbox

I learned the basics of Flexbox, a CSS layout method used to arrange elements in a flexible manner. The display: flex property changes an element into a flex container and allows its child elements to be positioned easily.

Flexbox Properties

justify-content

The justify-content property is used to control the alignment of flex items along the main axis. I practiced using it to position content at the start, center, end and with different spacing arrangements.

align-items

The align-items property is used to align flex items along the cross axis. I practiced using it to align elements vertically and to place content at the center of a container.

CSS Grid

I was introduced to CSS Grid, which is a layout system designed to arrange elements in rows and columns. I learned how a grid can be used to create organized and responsive webpage layouts.

Introduction to JavaScript

After completing the CSS layout concepts, I started learning JavaScript. JavaScript is a programming language used to add logic and interactivity to webpages. I learned the basic methods of connecting JavaScript with HTML and practiced simple JavaScript statements.

Methods of Adding JavaScript

During the session, I learned three methods of adding JavaScript to a webpage:

1. Inline JavaScript

Inline JavaScript is written directly inside an HTML element, generally through an event attribute. It can be useful for applying a small piece of JavaScript directly to a particular HTML element.

2. Internal JavaScript

Internal JavaScript is written inside a script section within the HTML document. It allows JavaScript code to be included in the same HTML file.

3. External JavaScript

External JavaScript is written in a separate JavaScript file and then linked to the HTML document. This method helps keep HTML and JavaScript code separate and makes code easier to manage.

console.log()

I learned to use console.log() to print or display information in the browser developer console. It is useful for checking values and understanding how JavaScript code is executing.

Variables in JavaScript

I learned the basic concept of variables in JavaScript. Variables are used to store data values that can be used later in a program. I was introduced to declaring variables and using their values in JavaScript statements.

Key Learning

- The div tag can be used to group and organize HTML content.
- Flexbox helps arrange elements in a flexible layout.
- justify-content controls alignment along the main axis.
- align-items controls alignment along the cross axis.
- CSS Grid is useful for arranging content in rows and columns.
- JavaScript adds logic and interactivity to webpages.
- JavaScript can be added using inline, internal and external methods.
- console.log() is used to display output in the browser console.
- Variables are used to store and work with data in JavaScript.

Conclusion:

The third day of training strengthened my understanding of webpage layout and introduced me to the fundamentals of JavaScript. I practiced Flexbox and Grid for arranging webpage elements and learned the basic concepts of JavaScript, including its three implementation methods, console.log() and variables. These concepts provide an important foundation for further learning JavaScript and the MERN stack.
