MERN STACK
TRAINING TR-103 REPORT DAY 4 25 JUNE 2026

Overview:

The fourth day of training focused on JavaScript data types and operators. The session covered the basic data types used in JavaScript, including String, Number, Boolean, Null and Undefined. I also learned different categories of operators, including arithmetic, assignment, logical and comparison operators, along with increment and decrement operators.

Learning Objectives:

- Understand the concept of data types in JavaScript.
- Learn String, Number, Boolean, Null and Undefined data types.
- Understand the purpose of operators in JavaScript.
- Learn arithmetic and assignment operators.
- Understand comparison and logical operators.
- Learn increment and decrement operators.

JavaScript Data Types

Data types specify the kind of value stored or used in a JavaScript program. During the training, I learned the following basic data types:

1. String

A String represents text or a sequence of characters. String values are used to store textual information.

2. Number

The Number data type is used to represent numeric values. It can be used for mathematical calculations and other numeric operations.

3. Boolean

Boolean represents one of two logical values: true or false. It is commonly used when working with conditions and decisions.

4. Null

Null represents the intentional absence of a value.

5. Undefined

Undefined indicates that a value has not been assigned or is not available.

JavaScript Operators

Operators are symbols used to perform operations on values and variables. I learned the following categories of operators:

Arithmetic Operators

Arithmetic operators are used to perform mathematical operations such as addition, subtraction, multiplication and division.

Assignment Operators

Assignment operators are used to assign values to variables and update their values.

Logical Operators

Logical operators are used to combine or evaluate logical conditions.

Comparison Operators

Comparison operators are used to compare values and produce a logical result.

Increment and Decrement Operators

Increment and decrement operators are used to increase or decrease a value, respectively, generally by one.

Key Learning:

- Learned five basic JavaScript data types: String, Number, Boolean, Null and Undefined.
- Learned how arithmetic operators are used for mathematical operations.
- Learned assignment operators for assigning and updating values.
- Learned comparison and logical operators for working with conditions.
- Learned increment and decrement operators for changing numeric values.

Conclusion:

The fourth day of training helped me understand important JavaScript fundamentals. I learned the basic data types and different categories of operators used in JavaScript. These concepts are essential for writing JavaScript programs and will support further learning of programming logic and web development.
